PowerPoint Skill Library: Draft for Review

1. Purpose

This tab catalogues every PowerPoint skill researched and tested for the Copilot Skill Library, following the project's clean-room approach: all testing used synthetic, de-identified content only, no Medibank data. Skills were sourced from three places, a third-party GitHub toolkit (kept as a benchmark, not a native capability), a community-authored Custom Skills pack for M365 Copilot in PowerPoint, and original skills to fill gaps the community pack didn't cover. Where skills were tested live against M365 Copilot, results were checked against the actual file (not just the chat summary) wherever possible, this caught at least one case where Copilot reported a completed action that had not actually happened, which is itself a useful finding.

2. Skill Levels

Level 1 — External Tool (Benchmark Only)	Third-party Python/GitHub scripts (Sentry01/copilot-cli-skills). Not a native Microsoft 365 Copilot capability, run outside PowerPoint via command line. Kept only as a reference benchmark, not proposed for the final Skill Library.
Level 2 — Adopted (Native Copilot Custom Skill, Community-Sourced)	Native M365 Copilot "Custom Skills" (confirmed mechanism via Microsoft Support docs), sourced unedited from a public community repo (heyitsgoad/copilot-playground, MIT-licensed, explicitly not an official Microsoft position).
Level 3 — Custom (Native Copilot Custom Skill, Original)	Native M365 Copilot Custom Skills authored from scratch by the project team to fill gaps the adopted set didn't cover (e.g. no chart-creation skill, no sensitive-data check, no translation).
Level 4 — Modified (Native Copilot Custom Skill)	Copies of an adopted skill, edited after live testing exposed a real defect. Demonstrates the project's own value-add: not just testing skills, but improving them.

3. Full Skill Breakdown, by Level

Level 1: External Tool (Benchmark Only)

ID	Skill	Level	What it does	Use case	Example prompt	Test result	
PPT-01	Inspect Presentation Structure (inspect_pptx.py)	Level 1	Parses a .pptx file via a Python script (python-pptx) and outputs structured JSON covering slide count, dimensions, layouts, shapes, text, tables, images, and speaker notes.	Auditing a deck's structure programmatically before editing or QA review.	N/A	EXTERNAL TOOL (not run in Copilot) -- PASS Correctly parsed a 6-slide synthetic deck including a table and a speaker note. Safe, read-only, no issues found.	
PPT-02	Extract Text & Speaker Notes (extract_text.py)	Level 1	Bulk-extracts all slide text and speaker notes from a .pptx file as Markdown, JSON, or plain text.	Repurposing deck content into summaries, translations, or other documents.	N/A	EXTERNAL TOOL (not run in Copilot) -- PARTIAL PASS Confirmed bug: misclassifies titles on the standard "Title Slide" layout as body text, because its title-detection check is incomplete. Affects most decks' opening and closing slides.	
PPT-03	Analyze Presentation Quality (analyze_pptx.py)	Level 1	Runs an automated QA pass on a .pptx file -- text density, missing titles, notes coverage, font consistency -- and outputs a stats + issues report.	Automated quality check before finalizing a deck.	N/A	EXTERNAL TOOL (not run in Copilot) -- PARTIAL PASS Inherits the same title-detection bug as PPT-02 (false "no title" flags). Its font-consistency check also reports zero fonts used on any deck relying on theme-inherited fonts -- the common case -- making that check effectively non-functional.	
PPT-04	Generate Slide Thumbnails (thumbnails.py)	Level 1	Converts a .pptx into a labeled JPEG grid of slide thumbnails for quick visual review outside PowerPoint.	Quick visual review of a deck without opening PowerPoint.	N/A	EXTERNAL TOOL (not run in Copilot) -- PASS Worked correctly, but requires installing LibreOffice and poppler outside the standard toolchain. Rejected as redundant with PowerPoint's built-in Slide Sorter view, which does the same job natively.	

Level 2: Adopted (Native Copilot Custom Skill, Community-Sourced)

ID	Skill	Level	What it does	Use case	Example prompt	Test result	
PPT-05	Apply Brand Template (apply-brand-template)	Level 2	Reformats a deck's fonts, colors, spacing, and logo placement to a defined brand identity, using Copilot's own formatting actions.	Bringing an off-brand deck into line with the organization's visual identity.	@apply-brand-template Apply our brand template (fonts, colors, logo) to this deck.	STRONG PASS Every font and color exactly matched the skill's configured brand tokens, confirmed by inspecting the file directly. Notably declined to add a placeholder logo when no verified one was available, rather than fabricating or guessing one.	
PPT-06	Fix This Slide (fix-this-slide)	Level 2	Cleans up the layout, spacing, and bullets of a single messy slide without changing its message.	Quickly tidying one problem slide before a review.	@fix-this-slide Fix this slide -- clean up the layout, spacing, and bullets.	PARTIAL PASS Could not reliably detect which slide was actually open or selected, and dropped an important qualifier ("subject to change") while shortening a bullet. Both issues are resolved in PPT-25, the project team's fixed version.	

PPT-07	Executive Summary Slide (executive-summary-slide)	Level 2	Scans an entire deck and inserts a new one-slide executive summary (3 takeaways + a recommendation) as slide 2.	Giving a busy executive a one-slide TL, DR of a longer deck.	@executive-summary-slide Give me an executive summary slide for this deck.	PASS All three takeaways and the recommendation matched the source deck exactly, with no invented numbers. Correctly stated a data gap instead of inventing a figure for an incomplete budget line.	
PPT-08	Speaker Notes (speaker-notes)	Level 2	Writes ~60-90 word conversational presenter notes into every slide's notes pane, plus an estimated total talk time.	Generating a first-draft talk track for a presenter.	@speaker-notes Write speaker notes for every slide in this deck.	PARTIAL PASS Content was accurate, but every slide's notes opened with the same repetitive template phrase ("The key point is..."), reading robotically across a whole deck. Resolved in PPT-26, the project team's fixed version.	
PPT-09	Doc to Deck (doc-to-deck)	Level 2	Converts a source document or pasted content into a structured slide deck: title, agenda, one slide per key idea, and a closing slide.	Turning a planning brief or set of notes into a first-draft deck.	@doc-to-deck Turn this document into a structured slide deck.	STRONG PASS The best guardrail compliance seen in the whole project. Every number, date, and name traced back to the source document exactly, and every slide containing added interpretation carried an explicit footer distinguishing sourced fact from the model's own reasoning. Directly validates one of Microsoft's own headline claimed Copilot capabilities.	
PPT-10	De-Jargon (de-jargon)	Level 2	Rewrites slide text in plain language for a non-technical or executive audience, while preserving facts and figures.	Simplifying a jargon-heavy internal deck before sharing it more broadly.	@de-jargon Rewrite this deck's slides in plain language, no jargon.	PASS Accurately simplified dense jargon-heavy bullets while preserving their original meaning. Correctly kept one essential technical term and added a short plain-language gloss instead of deleting it, exactly as its own guardrail specifies.	
PPT-11	Tighten Copy (tighten-copy)	Level 2	Shortens bullets to under ~10 words and removes filler phrases, without dropping any original point.	Making slide copy scannable before an executive review.	@tighten-copy Tighten the copy on this deck's slides -- shorter bullets, less filler.	PASS Compressed verbose, filler-heavy bullets to 6-8 words each while preserving every original idea -- nothing was silently dropped, only condensed.	
PPT-12	Consistency Check (consistency-check)	Level 2	Audits an entire deck for mismatched fonts, colors, capitalization, spacing, and inconsistent terminology, then asks before applying fixes.	A pre-delivery QA pass on a deck assembled by multiple authors.	@consistency-check Check this deck for font, color, and formatting inconsistencies.	PASS Caught 100% of a deliberately broken slide's font, color, and capitalization issues, plus several genuine secondary issues, with zero false positives. Outperformed the equivalent external Python tool (PPT-03) in accuracy.	
PPT-13	Fix Fonts (fix-fonts)	Level 2	Standardizes all fonts across a deck to one target font (e.g. Segoe UI) while preserving visual scale and fit.	Cleaning up font drift in a deck edited by multiple people.	@fix-fonts Standardize all fonts in this presentation to Segoe UI.	PASS Correctly standardized three mismatched fonts to one consistent font while leaving colors untouched (correct scope). Transparently disclosed that text baked into an image could not be updated, a limitation independently confirmed by three other skills.	
PPT-14	Accessibility Pass (accessibility-pass)	Level 2	Adds alt text to images, checks color contrast and font size against WCAG-AA, and verifies slide reading order.	Bringing a deck up to accessibility compliance standards.	@accessibility-pass Run an accessibility pass on this deck (alt text, contrast, font size, reading order).	PARTIAL PASS A genuinely important finding: a claimed alt-text fix was verified FALSE via direct file inspection (the image's alt text was never actually changed), while a separate claimed contrast fix was verified TRUE. Demonstrates that Copilot's own chat summary cannot be trusted without independently checking the file.	
PPT-15	Customer-Ready Pass (customer-ready-pass)	Level 2	Prepares a deck for external sharing: removes internal-only content and speaker notes, flags confidential items, and adds an approved disclaimer.	Final pass before sending an internal deck to a customer or external party.	@customer-ready-pass Make this deck ready to share externally -- strip internal content and add our disclaimer.	STRONG PASS Correctly removed multiple internal-only slides, including one with no explicit "internal" marking, and caught an unlabeled customer-PII slide through its own reasoning, redacting it intelligently rather than deleting it outright. One caveat: it wiped speaker notes deck-wide rather than only the internal-only one.	
PPT-16	QBR Builder (qbr-builder)	Level 2	Restructures existing content into a standard Quarterly Business Review flow: wins, status, pipeline, risks with mitigations, and asks.	Turning raw updates into a board- or leadership-ready QBR deck.	@qbr-builder Structure this content into a QBR deck (wins, status, pipeline, risks, asks).	STRONG PASS Preserved a sourced budget figure exactly and consistently marked every genuinely missing detail as "[NEEDS DATA]" instead of inventing one. Proactively asked who the audience was before deciding whether to include internal budget content, a safety behavior not explicitly required by its own instructions.	

Level 3: Custom (Native Copilot Custom Skill, Original)

ID	Skill	Level	What it does	Use case	Example prompt	Test result	
PPT-17	Data to Chart Slide (data-to-chart-slide)	Level 3	Converts pasted or referenced tabular data into a new slide with a real, editable native chart and a one-line takeaway.	Turning a raw data table into a presentable chart slide.	@data-to-chart-slide Turn this data into a chart slide: [paste data].	PASS Confirmed via direct file inspection to be a genuine native PowerPoint chart object, not an image, with data matching the source exactly and an accurate calculated takeaway. Fills a real gap, none of the adopted skills touch charts or data visualization.	

PPT-18	Translate Deck (translate-deck)	Level 3	Translates a deck's slide text and notes into a target language while preserving layout and untranslatable brand/legal terms.	Producing a localized version of a deck for a different market or audience.	@translate-deck Translate this deck into [target language].	PASS Produced natural, accurate Vietnamese translation, independently verified by a fluent speaker, including correct regional number formatting. Correctly flagged text embedded in an image as untranslatable rather than silently skipping it.	
PPT-19	Audience Variant Builder (audience-variant-builder)	Level 3	Produces separate executive, technical, and customer-facing versions of one source deck, adjusting depth and framing while keeping facts identical.	Repurposing one deck for several different audiences without rewriting from scratch.	@audience-variant-builder Create executive, technical, and customer-facing versions of this deck.	PASS The executive variant's figures were verified word-for-word identical to the source. The customer-facing variant, the one most likely to lose facts, since it involves content removal, was not independently re-checked and is flagged as a follow-up.	
PPT-20	Stakeholder Q&A Prep (stakeholder-qa-prep)	Level 3	Generates 8-12 likely stakeholder questions with grounded suggested answers, flagging anything the deck can't actually answer.	Preparing a presenter for tough questions before an executive review.	@stakeholder-qa-prep Prepare likely stakeholder questions and answers for this deck.	STRONG PASS Every answer was precisely grounded in the deck's real figures. Gap analysis was genuinely sophisticated rather than generic, for example, correctly noting the deck never forecasts the return on a funding request it's asking for.	
PPT-21	Sensitive Data Scan (sensitive-data-scan)	Level 3	Scans a deck's text, tables, and notes for patterns resembling IDs, policy numbers, emails, or phone numbers, and reports them for confirmation without editing anything.	A safety check before sharing a deck internally or externally, independent of any editing pass.	@sensitive-data-scan Scan this deck for any sensitive or identifying data patterns.	STRONG PASS The best-performing skill of the entire project: zero false positives and zero false negatives against every planted pattern. Explicitly refused to treat "fake" or "sample" labels as proof the data was safe, a genuinely sophisticated, unprompted safety behavior.	
PPT-22	Template Migration (template-migration)	Level 3	Maps an existing deck's slides onto a new approved template's layouts, preserving all content.	Moving a deck built on an old or deprecated template onto the current approved one.	@template-migration Migrate this deck onto our new approved template.	PARTIAL PASS Correctly asked for a real target template rather than guessing or fabricating one when none was available, the right safe behavior. The actual slide-by-slide migration logic remains untested until a real second template is supplied.	
PPT-23	Pacing Check (pacing-check)	Level 3	Estimates a deck's total speaking time against a target slot and suggests which slides to trim if it runs long.	Checking whether a deck fits its allotted presentation time before delivering it.	@pacing-check Check if this deck fits a 15-minute presentation slot.	PASS With no speaker notes present, it correctly estimated timing from visible word count and transparently stated that assumption rather than failing or guessing silently. Its time math checked out exactly against the stated total.	
PPT-24	Visual Suggestion Pass (visual-suggestion-pass)	Level 3	Reviews text-heavy slides and suggests specific, concrete visual ideas, without generating or inserting any image itself.	Identifying where a data-heavy or wall-of-text deck would benefit from a visual.	@visual-suggestion-pass Suggest where visuals would help in this deck.	STRONG PASS Suggestions were specific and grounded in the deck's real figures, not generic. It also correctly identified slides that did NOT need a visual (an intentionally sparse cover, a slide whose table already served the purpose) instead of suggesting one for every slide.	
Level 4: Modified (Native Copilot Custom Skill, Fixed)							
ID	**Skill**	**Level**	**What it does**	**Use case**	**Example prompt**	**Test result**	
PPT-25	Fix Slide By Number (fix-slide-by-number)	Level 4	A project-team-modified version of PPT-06 that always confirms the target slide number before acting, instead of assuming slide-selection detection works, and explicitly preserves uncertainty language.	Same as PPT-06, for teams who found the original unreliable at targeting the right slide.	@fix-slide-by-number Fix slide 5 -- clean up the layout, spacing, and bullets.	PASS Resolved both issues found in PPT-06: correctly flagged the detected slide for confirmation, and fully preserved qualifiers like "subject to change" that the original had dropped.	
PPT-26	Speaker Notes Varied (speaker-notes-varied)	Level 4	A project-team-modified version of PPT-08 that explicitly forbids a templated opening phrase and checks that no two slides' notes start the same way.	Same as PPT-08, for teams who found the original's notes repetitive across a deck.	@speaker-notes-varied Write speaker notes for every slide in this deck.	PASS Resolved the issue found in PPT-08: openers varied naturally across every slide, with no repeated template phrase.
